What is a Data structure?

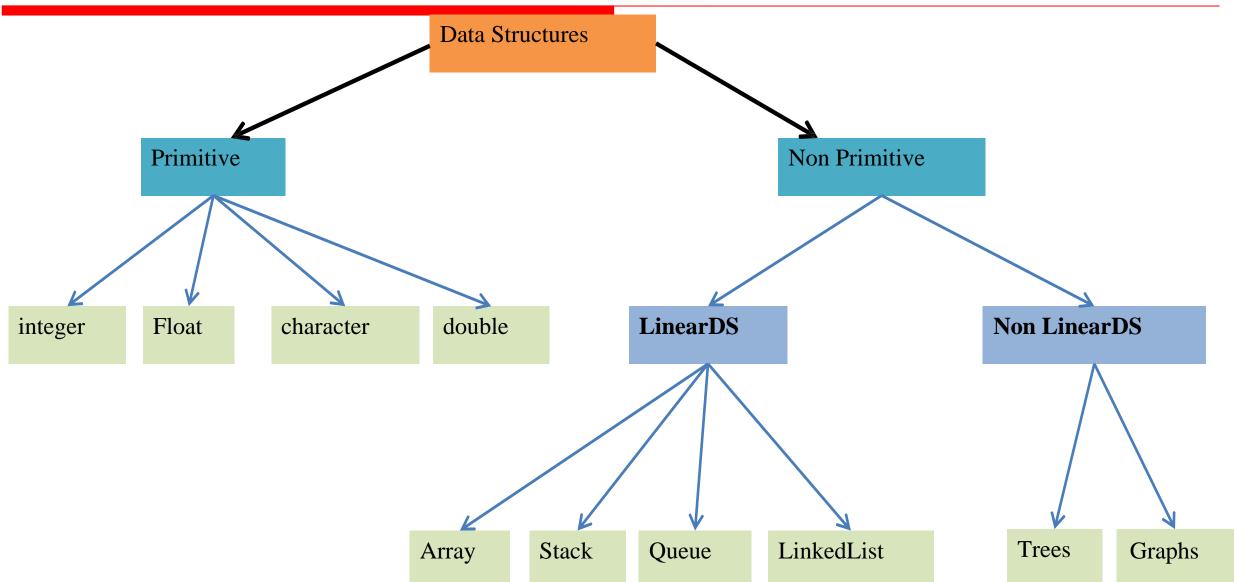

Data Structure is a set of algorithms which are used to structure the information while storing.

• Formal definition is data structure is a way of storing and organizing data in a computer so that it can be used and accessed efficiently.

(Christian Minority Educational Institute)
Approved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

1.Linear data structure

All the elements are accessed in sequential order or linear order means that all the elements are adjacent to each other. Each element has exactly two neighbor-. Predecessor and successor.

- the first element does not have predecessor
- The last element does not have successor.

2. Non linear data structure

-no such sequence in elements, if one element is connected to a more than two adjacent element then it is a non linear data structure.

ST. FRANCIS INSTITUTE OF TECHNOLOGY (ENGINEERING COLLEGE) (Christian Minority Educational Institute) Approved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022 DTE Code: EN 3204

Linear data Structures	Non Linear Data Structures

Operations on Data structures

Insertion

It is used to add new data items to the given list of data items. For example, to add the details of a new student who has recently joined the course

Deletion

It means to remove (delete) a particular data item from the given collection of data items. For example, to delete the name of a student who has left the course

Searching

It is used to find the location of one or more data items that satisfy the given constraint.

Traversal

It means to access each data item exactly once so that it can be processed. For example, to print the names of all the students in a class

Sorting

Data items can be arranged in some order like ascending order or descending order depending on the type of application. For example, arranging the names of students in a class in an alphabetical order, or calculating the top three winners by arranging the participants' scores in descending order and then extracting the top three.

Merging

Lists of two sorted data items can be combined to form a single list of sorted data items.

□ Self-learning Topics:

☐ Linked List Implementation of Stack, Linked List implementation of Queue, Circular Queue, Double Ended Queue, Priority Queue.

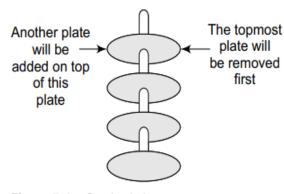

oproved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai

Stacks

It is a linear, abstract data structure

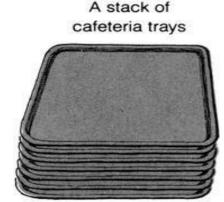

Definition - A stack is an ordered collection of homogeneous data elements, where the insertion and deletion takes place at one end, known as TOP.

- The stack is also called LAST IN FIRST OUT(LIFO)
- It means: the element which is inserted last must be deleted first
- Real world Examples
 - 1.pile of plates in cafeteria
 - 2.stack of coins

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumba
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

- ❖ Stack maintains a pointer called top, which keeps track of the top most element in the stack.
- Any insertions or deletions should be based upon the value of top.
- * It works on the basis of LIFO (Last in First out).
- According to the definition, new elements are inserted from top and the elements are deleted from same end i.e again top.
- ❖ This suggests that the element inserted most recently can only be deleted.
- ❖ In the stack, the elements are removed in the reverse order of that in which they were added to the stack i.e last element inserted is to be deleted first.
- ❖ Stack has structured with two operations
- 1. push- insertion-adding elements on to a stack
- 2. Pop- deletion -removing element from the stack

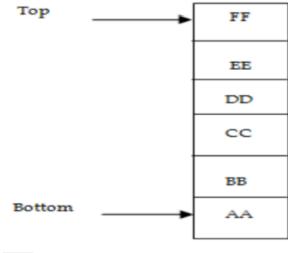

Figure 1.4: A Stack

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai
SO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

Basic operations:

- *The basic or primary operations are insertion, deletion, display.
- ❖ In stacks, special terms are given for insert and delete. i.e push for insert and pop is for delete.
- ❖ Push: inserting or adding element into the stack is called push.
- Pop: deleting or removing element from the stack is called pop.
- ❖ Peek: Returns the topmost element of the stack without deleting

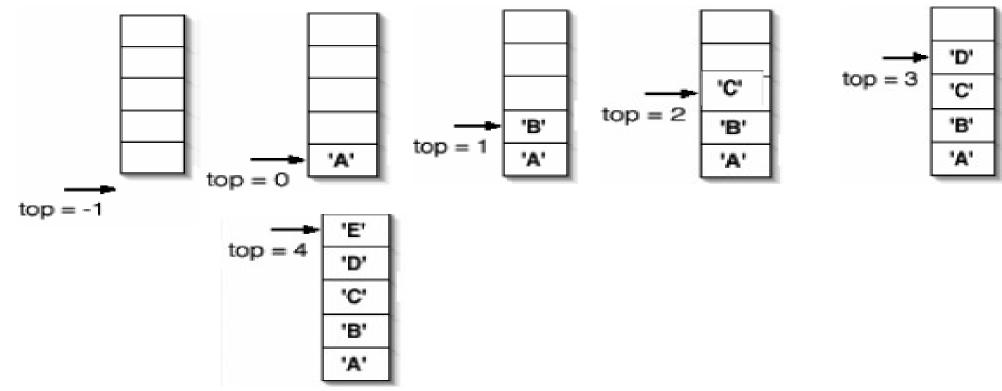

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)

Approved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

DTE Code: EN 3204

PUSH Operation

- ❖ Elements are inserted in the order as A,B,C,D,E
- ❖ It represents the stack of 5 elements.

- ❖ The top most element in the stack is E
- ❖ If we want to delete element E has to be deleted first

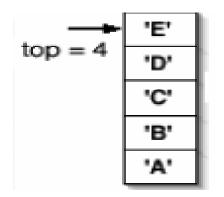

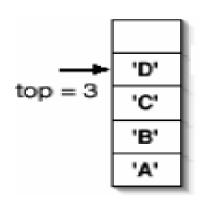

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)

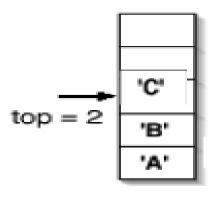

Approved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

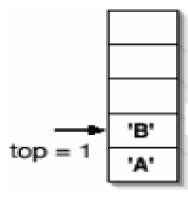

DTE Code: EN 3204

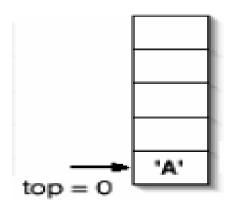

❖ Pop operation- delete element from the stack

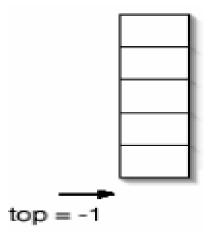

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)
Approved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

DTE Code: EN 3204

Example:-

```
push('A');
push('B');
push('D');
pop();
push('C');
push('D');
push('E');
pop();
pop();
. . .
```

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

- DTE Code : EN 3204
- 1. int stack[5]; Fixed size stack of size 5
- 2. **Top** = -1; pointer points to latest element in stack, initially -1 when stack is empty
- 3. void push(); Inserting elements into stack after incrementing top by 1
- 4. void pop(); Deleting element from stack and then decrementing top by 1
- 5. Void peek(); Returing topmost element with the help of TOP
- 6. void display(); show elements
- 7. void isEmpty(); check for underflow
- 8. void isFull(); Check for Overflow

(ENGINEERING COLLEGE)

roved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, SO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

Arrays Implementation of Stack

Algorithm for inserting element into the stack:

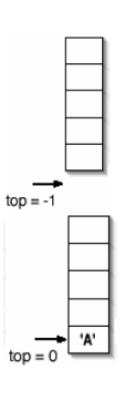

else

2.read item or data

 $3.\text{top}\leftarrow\text{top}+1$

4.stack[top]← item

5.stop

- The stack is of size max. This procedure inserts an element item on to the top of a stack which is represented by an array stack.
- ❖ The first step of this algorithm checks for an overflow condition.
- ❖ Overflow means inserting element into a stack which is full.
- ❖ If the top value reaches to maximum capacity of the stack then elements cannot be inserted into the stack i.e. stack is full.
- ❖ Otherwise top is incremented by one and element is inserted into the stack.

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

Algorithm to delete elements from the stack:

Algorithm pop()

 $3. top \leftarrow top-1$

Explanation:

- ❖ This procedure deletes an element from the stack.
- The first step of this algorithm checks for underflow condition.
- ❖ If the top value is -1 then stack is empty.
- Empty stack is known as underflow.
- ❖ Takeout the element from the location where, the top is pointing and then decrement top by one.

(ENGINEERING COLLEGE)

(Christian Minority Educational Institute)

proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbal, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

DTE Code: EN 3204

Display of stack:

Printing the contents of stack after push and pop operations.

```
Algorithm print()
1.if top=-1
then write ('stack empty')
1.Repeat for i ← top to 0
print(stack[i])
1.stop
```

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbal, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

- Limitation in stack using array is that maximum size of the stack must be predefined and it cannot be changed (fixed).
- When trying to add elements in the stack when the stack is full will rise the exception.

(ENGINEERING COLLEGE)

proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

DTE Code: EN 3204

When E has Function D executed, D will Function C be removed for Function B execution. Function A When C has executed, B will Function B be removed for Function A execution. When D has Function C executed. C will Function B be removed for Function A execution. When B has executed, A will be removed for Function A execution.

Figure 7.3 System stack when a called function returns to the calling function

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)

proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

DTE Code: EN 3204

Applications of stacks-Parenthesis matching

- The objective of this function is to check the matching of parenthesis in an expression
- i.e In an expression the number of left parenthesis must be equal to number of right parenthesis.
- Ex: ((A+B)*C)
- This is a valid expression, because in this number of left parenthesis (2) = number of right parenthesis (2).

(Christian Minority Educational Institute)

oroved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

Review Question on Data structure Stacks:

- 1. What do you understand by stack overflow and underflow?
- 2. Stack is a (a) LIFO (b) FIFO
- 3. Write a function that accepts two stacks. Copy the contents of first stack in the second stack. Note that the order of elements must be preserved. (Hint: use a temporary stack)
- 4. Which function places an element on the stack? (a) Pop() (b) Push() (c) Peek() (d) isEmpty()
- 5. When an Element is Placed on to the stack, the top is incremented/decremented/remains unchanged

University Questions:

Explain the working of stack with its operations: push, pop, peek, display, empty, full. Proper diagrammatic representations of operations as mentioned above, are also expected. Also, write two applications (algorithms) where stack data structure is used.

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

DTE Code: EN 3204

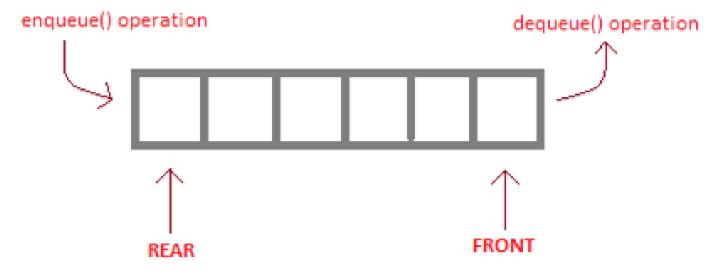

Concept of Queue

- A linear and Abstract Data types
- A queue is a first-in, first-out (FIFO) data structure in which the element that is inserted first is the first one to be taken out.
- The elements in a queue are added at one end called the rear and removed from the other end called the front.
- Like stacks, queues can be implemented by using either arrays or linked lists.

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumba
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022
DTE Code: EN 3204

The process to add an element into queue is called **Enqueue** and the process of removal of an element from queue is called **Dequeue**

enqueue() is the operation for adding an element into Queue.
dequeue() is the operation for removing an element from Queue.

QUEUE DATA STRUCTURE

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

Real life Scenarios:

- Serving requests on a single shared resource, like a printer, CPU task scheduling etc.
- In real life scenario, Call Centre phone systems uses Queues to hold people calling them in an order, until a service representative is free.
- Handling of interrupts in real-time systems. The interrupts are handled in the same order as they arrive i.e First come first served.

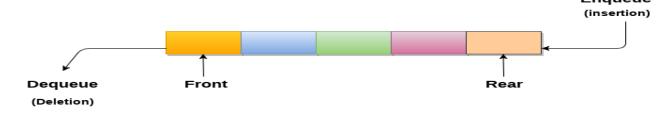

(Christian Minority Educational Institute)

pproved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

Implementation of Queue Data Structure

- Queue can be implemented using an <u>Array</u> or <u>Linked List</u>.
- A queue is a first-in, first-out (FIFO) data structure in which the element that is inserted first is the first one to be taken out.
- The easiest way of implementing a queue is by using an Array.
- Initially the head(FRONT) and the tail(REAR) of the queue points at the first index of the array (starting the index of array from 0).
- As we add elements to the queue, the tail keeps on moving ahead, always pointing to the position where the next element will be inserted, while the head remains at the first index.

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

Queue as an ADT

- Create(): creates and initializes new queue that is empty. Does not require any parameter and return empty queue
- Enqueue(item): Adds new element to the rear of the queue. It requires the element to be added and return nothing
- Dequeue(): removes element from front end of the queue, does not require any parameter and return the deleted items
- isEmpty(): checks whether the queue is empty or not. Return a Boolean value
- isFull(): checks whether the queue is full or not, return Boolean value
- Size(): return total number of elements present in the queue, returns an integer

(ENGINEERING COLLEGE)

Figure 8.1 Queue

Figure 8.2 Queue after insertion of a new element

	9	7	18	14	36	45			
0	1	2	3	4	5	6	7	8	9

Figure 8.3 Queue after deletion of an element

Operations on Queues

In Fig. 8.1, FRONT = 0 and REAR = 5. Suppose we want to add another element with value 45, then REAR would be incremented by 1 and the value would be stored at the position pointed by REAR. The queue after addition would be as shown in Fig. 8.2. Here, FRONT = 0 and REAR = 6. Every time a new element has to be added, we repeat the same procedure.

If we want to delete an element from the queue, then the value of FRONT will be incremented. Deletions are done from only this end

of the queue. The queue after deletion will be as shown in Fig. 8.3.

Here, FRONT = 1 and REAR = 6.

72

45

36

Figure 8.14 Queue after two successive deletions

18

14

Suppose we want to insert a new element in the queue shown in Fig. 8.14.

Even though there is space available, the overflow condition still exists because the condition rear = MAX - 1 still holds true.

This is a major drawback of a linear queue.

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

☐ Circular Queue

Q[6] Q[1] Q[1] Q[5]

Figure 8.15 Circular queue

To resolve the problem of linear queues, we have two solutions.

First, shift the elements to the left so that the vacant space can be occupied and utilized efficiently. But this can be very time-consuming, especially when the queue is quite large.

The second option is to use a circular queue.

In the circular queue, the first index comes right after the last index. Conceptually, you can think of a circular queue as shown in Fig. 8.15

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai
SO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022
DTE Code: EN 3204

☐ Circular Queue

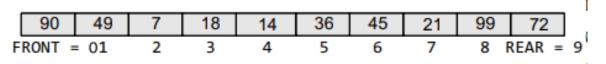

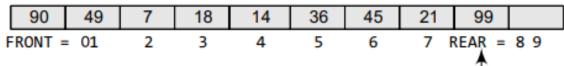

Figure 8.16 Full queue

Increment rear so that it points to location 9 and insert the value here

Figure 8.17 Queue with vacant locations

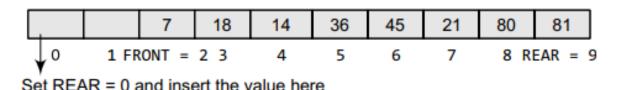

Figure 8.18 Inserting an element in a circular queue

- If front = 0 and rear = MAX 1, then the circular queue is full. Look at the queue given in Fig. 8.16 which illustrates this point.
- If rear != MAX 1, then rear will be incremented and the value will be inserted as illustrated in Fig. 8.17.
- If front != 0 and rear = MAX 1, then it means that the queue is not full. So, set rear = 0 and insert the new element there, as, shown in Fig. 8.18

(ENGINEERING COLLEGE)

(Christian Minority Educational Institute)

proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

☐ Circular Queue (enqueue)

Limitation Of Circular queue

Figure 8.19 Algorithm to insert an element in a circular queue

- If front = 0 and rear = MAX 1, then the circular queue is full. Look at the queue given in Fig. 8.16 which illustrates this point.
- If rear != MAX 1, then rear will be incremented and the value will be inserted as illustrated in Fig. 8.17.
- If front != 0 and rear = MAX 1, then it means that the queue is not full. So, set rear = 0 and insert the new element there, as shown in Fig. 8.18

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

☐ Circular Queue(dequeue)

condicioned for dialphed.			

- Look at Fig. 8.20. If FRONT = -1, then there are no elements in the queue. So, an underflow condition will be reported.
- If the queue is not empty and FRONT = REAR, then after deleting the element at the front the queue becomes empty and so FRONT and REAR are set to -1. This is illustrated in Fig. 8.21.
- If the queue is not empty and FRONT = MAX-1, then after deleting the element at the front, FRONT is set to 0. This is shown in Fig. 8.22.

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai, ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

☐ Circular Oueue

```
Step 1: IF FRONT = -1
            Write "UNDERFLOW"
            Goto Step 4
       [END of IF]
Step 2: SET VAL = QUEUE[FRONT]
Step 3: IF FRONT = REAR
            SET FRONT = REAR = -1
        ELSE
            IF FRONT = MAX - 1
                  SET FRONT = 0
            ELSE
                  SET FRONT = FRONT + 1
            [END of IF]
       [END OF IF]
Step 4: EXIT
```

Figure 8.23 Algorithm to delete an element from a circular queue

- Look at Fig. 8.20. If FRONT = -1, then there are no elements in the queue. So, an underflow condition will be reported.
- If the queue is not empty and FRONT = REAR, then after deleting the element at the front the queue becomes empty and so FRONT and REAR are set to -1. This is illustrated in Fig. 8.21.
- If the queue is not empty and FRONT = MAX-1, then after deleting the element at the front, FRONT is set to 0. This is shown in Fig. 8.22.

☐ Double Ended Queue (DE-Queue)

is a list in which the elements can be inserted or deleted at either end. It is also known as a head-tail linked list because elements can be added to or removed from either the front (head) or the back (tail) end

However, no element can be added and deleted from the middle.

(ENGINEERING COLLEGE)

☐ Priority Queue:

- Each element is assigned a priority.
- Priority determines the order in which the elements will be processed
- An element with higher priority is processed before an element with a lower priority.
- Two elements with the same priority are processed on a first-come-firstserved (FCFS) basis
- widely used in operating systems to execute the highest priority process first.

(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai,
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

☐ Priority Queue:

For example, if there are three processes, where the first process needs 5 ns to complete, the second process needs 4 ns, and the third process needs 7 ns, then the second process will have the highest priority and will thus be the first to be executed.

However, CPU time is not the only factor that determines the priority, rather it is just one among several factors.

☐ Concept of Linked Lists

- is a linear collection of data elements.
- user can add any number of elements to it
- data elements are called nodes
- acts as a building block to implement data structures such as stacks, queues, and their variations
- each node contains data field and a pointer to the next node.

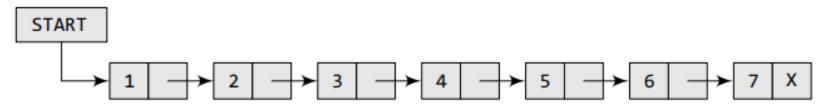

Figure 6.1 Simple linked list

(ENGINEERING COLLEGE)

□ Concept of Linked Lists

In C, we can implement a linked list using the following code:

```
struct node
{
    int data;
    struct node *next;
};
```

Node: every elements in linked list is called node

Data: information or actual value

Next is a second part of a node, it contains address of next node. It helps us to go from one node to other node

START is used to store the address of the first node.

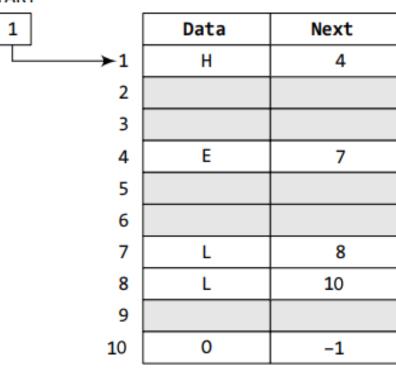

Figure 6.2 START pointing to the first element of the linked list in the memory

a position where the NEXT entry contains -1 or NULL is end of the linked list

SO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022

DTE Code: EN 3204

☐ Concept of Linked Lists

Header node:

- A pointer that always points to the first node of the linked list
- It is considered as a reference to the link list.
- You can also call it Start node
- If start node or header value is NULL means the link list is empty

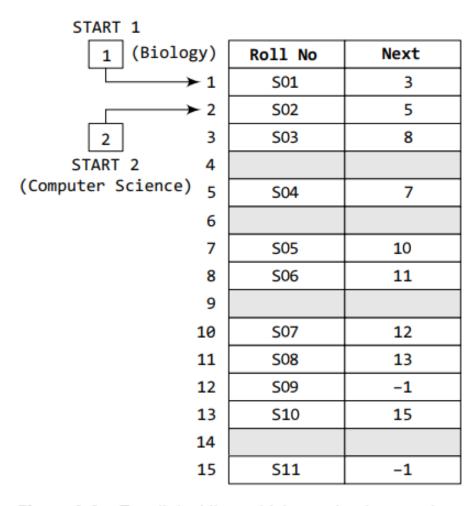

Figure 6.3 Two linked lists which are simultaneously maintained in the memory

☐ Memory Allocation and deallocation in Linked list

- Dynamic Memory allocation
- As per the necessity allocation and de allocation occurs
- Avoids memory shortage and memory wastage
- Use of malloc()
- Deallocating by using free function()

(Christian Minority Educational Institute)

Singly Linked Lists

- every node contains some data and a pointer to the next node of the same data type.
- the node stores the address of the next node in sequence.
- A singly linked list allows traversal of data only in one way.

Note: Since in a linked list, every node contains a pointer to another node which is of the same type, it is also called a **self-referential data type**

DTE Code: EN 3204

☐ Inserting nodes in Linked Lists

Case 1: The new node is inserted at the beginning.

```
Step 1: IF AVAIL = NULL

Write OVERFLOW
Go to Step 7

[END OF IF]

Step 2: SET NEW_NODE = AVAIL

Step 3: SET AVAIL = AVAIL -> NEXT

Step 4: SET NEW_NODE -> DATA = VAL

Step 5: SET NEW_NODE -> NEXT = START

Step 6: SET START = NEW_NODE

Step 7: EXIT
```

Figure 6.13 Algorithm to insert a new node at the beginning

- we first check whether memory is available for the new node.
- If the free memory has exhausted, then an OVERFLOW message is printed.
- Otherwise, if a free memory cell is available, then we allocate space for the new node.
- Set its DATA part with the given VAL and the next part is initialized with the address of the first node of the list, which is stored in START.
- Now, since the new node is added as the first node of the list, it will now be known as the START node, that is, the START pointer variable will now hold the address of the NEW_NODE

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)

proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumbai

☐ Concept of Linked Lists

```
Step 1: IF AVAIL = NULL
            Write OVERFLOW
            Go to Step 12
       [END OF IF]
Step 2: SET NEW_NODE = AVAIL
Step 3: SET AVAIL = AVAIL -> NEXT
Step 4: SET NEW NODE -> DATA = VAL
Step 5: SET PTR = START
Step 6: SET PREPTR = PTR
Step 7: Repeat Steps 8 and 9 while PREPTR -> DATA
        != NUM
            SET PREPTR = PTR
Step 8:
            SET PTR = PTR -> NEXT
Step 9:
         [END OF LOOP]
Step 10: PREPTR -> NEXT = NEW_NODE
Step 11: SET NEW_NODE - > NEXT = PTR
Step 12: EXIT
```

Figure 6.16 Algorithm to insert a new node after a node that has value NUM

- PREPTR which will be used to store the address of the node preceding PTR. Initially, PREPTR is initialized to PTR.
- So now, PTR, PREPTR, and START are all pointing to the first node of the linked list.
- In the while loop, we traverse through the linked list to reach the node that has its value equal to NUM. We need to reach this node because the new node will be inserted after this node.
- Once we reach this node, in Steps 10 and 11, we change the NEXT pointers in such a way that new node is inserted after the desired node.

(ENGINEERING COLLEGE)
(Christian Minority Educational Institute)
proved by AICTE & Govt. of Maharashtra with Permanent Affiliation to University of Mumba
ISO 9001:2015 Certified, Two UG Courses (EXTC & INFT) NBA Accredited till June 2022
DTE Code: EN 3204

☐ Inserting nodes in Linked Lists

Case 1: The new node is inserted at the beginning.

```
Step 1: IF AVAIL = NULL

Write OVERFLOW

Go to Step 7

[END OF IF]

Step 2: SET NEW_NODE = AVAIL

Step 3: SET AVAIL = AVAIL -> NEXT

Step 4: SET NEW_NODE -> DATA = VAL

Step 5: SET NEW_NODE -> NEXT = START

Step 6: SET START = NEW_NODE

Step 7: EXIT
```

Figure 6.13 Algorithm to insert a new node at the beginning

Step 2: SET NEW_NODE = AVAIL Step 3: SET AVAIL = AVAIL -> NEXT

These steps allocate memory for the new node.

In C, there are functions like malloc(), alloc, and calloc() which automatically do the memory allocation on behalf of the user.

(ENGINEERING COLLEGE)

☐ Inserting nodes in Linked Lists

Case2: Inserting a Node at the End of a Linked List

Allocate memory for the new node and initialize its DATA part to 9 and NEXT part to NULL.

9 X

Take a pointer variable PTR which points to START.

Move PTR so that it points to the last node of the list.

Add the new node after the node pointed by PTR. This is done by storing the address of the new node in the NEXT part of PTR.

Figure 6.14 Inserting an element at the end of a linked list

- we take a pointer variable PTR and initialize it with START.
- That is, PTR now points to the first node of the linked list.
- In the while loop, we traverse through the linked list to reach the last node.
- Once we reach the last node, we change the NEXT pointer of the last node to store the address of the new node.
- Remember that the NEXT field of the new node contains NULL, which signifies the end of the linked list.

Step 3: SET AVAIL = AVAIL -> NEXT
Step 4: SET NEW NODE - > DATA = VAL
Step 5: SET PTR = START
Step 6: SET PREPTR = PTR
Step 7: Repeat Steps 8 and 9 while PREPTR -> DATA
        I = NUM
Step 8:
            SET PREPTR = PTR
Step 9:
            SET PTR = PTR -> NEXT
         [END OF LOOP]
Step 10: PREPTR -> NEXT = NEW NODE
Step 11: SET NEW NODE - > NEXT = PTR
Step 12: EXIT
```

Figure 6.16 Algorithm to insert a new node after a node that has value NUM

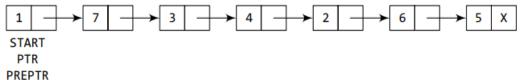

START

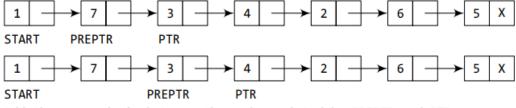

Allocate memory for the new node and initialize its DATA part to 9.

9

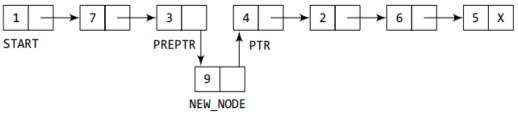

Take two pointer variables PTR and PREPTR and initialize them with START so that START, PTR, and PREPTR point to the first node of the list.

Move PTR and PREPTR until the DATA part of PREPTR = value of the node after which insertion has to be done. PREPTR will always point to the node just before PTR.

Add the new node in between the nodes pointed by PREPTR and PTR.

☐ Insertion in the middle before given node in Linked Lists

```
Step 1: IF AVAIL = NULL
            Write OVERFLOW
            Go to Step 12
        [END OF IF]
Step 2: SET NEW_NODE = AVAIL
Step 3: SET AVAIL = AVAIL -> NEXT
Step 4: SET NEW NODE -> DATA = VAL
Step 5: SET PTR = START
Step 6: SET PREPTR = PTR
Step 7: Repeat Steps 8 and 9 while PTR -> DATA != NUM
            SET PREPTR = PTR
Step 8:
Step 9:
            SET PTR = PTR -> NEXT
        [END OF LOOP]
Step 10: PREPTR -> NEXT = NEW NODE
Step 11: SET NEW NODE -> NEXT = PTR
Step 12: EXIT
```

Figure 6.18 Algorithm to insert a new node before a node that has value NUM

□ Deleting nodes in Linked Lists

Three cases:

Case 1: The first node is deleted.

Case 2: The last node is deleted.

Case 3: The node after a given node is deleted.

Note: Underflow is a condition that occurs when we try to delete a node from a linked list that is empty.

This happens when START = NULL or when there are no more nodes to delete.

☐ Deleting nodes in Linked Lists Case 1: The first node is deleted.

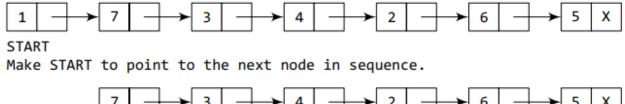

Figure 6.20 Deleting the first node of a linked list

START

```
Step 1: IF START = NULL

Write UNDERFLOW

Go to Step 5

[END OF IF]

Step 2: SET PTR = START

Step 3: SET START = START -> NEXT

Step 4: FREE PTR

Step 5: EXIT
```

- In Step 1, we check if the linked list exists or not.
- If START = NULL, then it signifies that there are no nodes in the list and the control is transferred to the last statement of the algorithm.
- However, if there are nodes in the linked list, then
 we use a pointer variable PTR that is set to point to
 the first node of the list.
- For this, we initialize PTR with START that stores the address of the first node of the list.
- In Step 3, START is made to point to the next node in sequence and finally the memory occupied by the node pointed by PTR (initially the first node of the list) is freed and returned to the free pool.
